

Selene

A privacy-first mobile Solana wallet — your keys never touch the phone.

CLOCK IN · Solana Mobile Hackathon · \$135K pool · Native Android + APK + MWA

THE PITCH

Seeker's next billion users arrive on mobile with a wallet already in their pocket. Selene is the **wallet for the Solana smartphone era**: self-custody, one screen, zero telemetry. Keys never live on the device — every transaction is authorized inside the user's existing MWA wallet (Phantom, Solflare, Seeker) over a secure local link.

WHY IT'S MOBILE-FIRST (NOT A WEB WRAPPER)

- Built on **Mobile Wallet Adapter** with **LocalAssociationScenario** — a real local WebSocket association session with 90s grace window, launched via association intent.
- Native Jetpack Compose + Kotlin; single-screen balance/send/activity UX designed for a phone, not a browser.
- Deep Solana network interaction: SOL legacy transfers, SPL USDC via Token Program v3, and **automatic ATA creation** for recipients without a USDC account — all in one byte-exact message.

FEATURES IMPLEMENTED

Feature	Implementation
MWA connect	LocalAssociationScenario — local WebSocket, association intent, 90s grace
SOL approvals	Legacy tx compiled in-app, signed via wallet's signAndSendTransactions
USDC (SPL) transfers	Token Program v3, accounts via getTokenAccountsByOwner
Auto token-account creation	Recipient has no USDC account → ATA created on the fly (PDA + create + transfer, byte-exact)
Privacy by construction	No telemetry, no analytics, no remote config — only wallet + public RPC

WHY WE WIN

- **Shipping APK (16.1 MB)** — judges install and run it, they don't read about it.
- **Native Mobile Stack depth** — real MWA LocalAssociation, real SPL transfers, real ATA creation: the deepest integration bar CLOCK IN rewards.
- **Honest simplicity** — the best wallet is the one you don't think about; privacy is not a feature, it's the absence of features.
